Version 2.3.6

Validate Declared Quantities (Scrap/Returns)

Scrap validation and preparation/release gating

Materials linked to the return of other materials (or the same code) require the declared scrap/returns to be CONFIRMED by the controller. Without confirmation, the material request cannot be prepared nor released.

1. Declaration (warehouse)

In the Scrap form the warehouse declares the returned kg for the scrap code (MustCode), as before.

2. Validation (control)

From Indirect Materials > 'Validate Declared Quantities', select the record, enter the Measured weight and click 'Validate': the system saves the confirmed weight, the user and the result (compliant if the weight matches).

3. Effect on prep/release

In 'Confirm Materials', preparation and release of a request are blocked until the linked scrap is confirmed; a message tells you to use 'Validate Declared Quantities'.

The 'Confirm Materials' menu item now requires the 'rilascia_materiali' authorization.

Without validation (compliant result) a material linked to a return stays blocked in preparation and release.
