Warehouse shipping

Finished, warehoused orders in the shipping list

TraceabilityRS - Version 2.4.2

Login: Requires authentication (Urgent/Orders menu key)

The shipping list (Orders > Urgent) used to show only the orders already matched by the planners (sales order <-> production order). It now also includes, without duplication, the orders that finished production and were loaded into the warehouse but not yet shipped. The shipping clerk matches them to a sales order, sets the destination and proceeds as with the planners' orders.

Row colors

- YELLOW = 'to match' row: a warehouse order with no sales order. The shown quantity is the available one (warehoused minus already matched and already shipped).
- RED = urgent order (already planned) whose goods are already in the warehouse: ready to ship (compared by order, even if the warehoused quantity differs from the requested one).

1. Matching a warehouse order

Select a yellow row and double-click (or use the 'Match / Correct' button). You pick the sales order with the same product and the quantity.

- Double-click the yellow row (or the Match / Correct button)
- Choose the sales order from the list (same product, with available remainder)
- Enter the quantity (not above the minimum of warehouse-available and order remainder)
- Set date/time and destination (Normal Shipment / Direct to final Customer)
- Press Match and create rule

NOTE: the sales order must have the SAME product (same code, without the version suffix). If no sales order exists yet for that product, the row stays to be matched until the related order is imported.

2. 'Already shipped' correction (alignment)

Until all shipments go through the system, goods already shipped outside the system would remain wrongly available. From the same window, the 'Already shipped' button lets you declare how much of the order has already been shipped: that quantity leaves the availability. The correction is recorded with user, date and

note.

Start date

Availability considers only goods warehoused from a 'zero point' date onward ('data_inizio_spedizioni' setting): before that date everything is assumed already shipped. The 'already shipped' correction serves precisely to align cases warehoused after that date and already shipped.

Destination in the email

On shipment confirmation, the email shows for each pallet the destination (Normal Shipment or Direct to final Customer); direct-to-final-customer shipments are highlighted.
