Touch-up

Board problem reporting and routing to technicians

TraceabilityRS - Version 2.4.2

Acces: Requires authentication (login) with dedicated keys

The Touch-up module lets touch-up operators report problems found on electronic boards. The system automatically routes the report to the technicians of the competent department (by problem type), triggers popups on the configured workstations and handles recurrences, reopenings and escalation to the supervisor.

1. Detected problems (operator)

Enter one or more boards by their LabelCode (verified by the system as in FAI) and select one or more problems from the list. On save the report is created and, if needed, triggers popups and sends emails.

- Type the LabelCode and press 'Verify and add' (shows order and product)
- Add more boards if the same problem affects several boards
- Select one or more problems from the list (multi-select)
- Press Save report

NOTE: the LabelCode must exist in the system. Boards of the same order with the same problem are recognized as RECURRENT.

2. Solutions taken (technician)

The technician sees the open reports (NEW/REOPENED), opens the detail (boards, order, product, problems), writes the actions taken and confirms. On confirmation the report is CLOSED and the reaction time is recorded.

3. Reports

Touch-up reporting section (reaction times, recurrences, reopenings). Coming soon.

4. Workstation setup

Enable or disable Touch-up popups on THIS PC. Same logic as the Indirect Materials / Shift Handover workstation: a simple Enable/Disable (local marker touchup_host.json).

5. Management

Module configuration, restricted to supervisors:

Item	Description
Problems	Catalog of problems shown in the combo (new / edit / deactivate)
Routing	For each problem, the destination departments (CdC / SubCdC) to receive popups and emails
Escalation params	Minutes without response before escalation to supervisor and recurrence/day threshold

Recurrences, reopenings and escalation

- **RECURRENCE:** same order+problem pair already reported → high priority + warning email
- **REOPENING:** same product+problem on an already closed report → REOPENED status and reopen count
- **DAILY THRESHOLD:** same problem more than N times in the production day (07:30→07:30) → escalation to supervisor
- **NO RESPONSE:** report open beyond the configured minutes → automatic email to the supervisor

Warning emails are sent to the routed department recipients (technicians) with the supervisor in copy; the service address is the 'Sys_email_TouchUp_warning' key.

ACCESS: item 1 key 'operatore_touchup'; item 2 'tecnico_risponde_touchup'; item 4 'attiva_workstation_tecnici'; item 5 'set_up_touchup'. Item 3 (Reports) has no login.
